2.3.2

pH

Why do we care about the $[H^+]$ anyway? What is special about this particular ion? Well, it turns out that either too much or too little H^+ can cause serious problems to chemical reactions. We use the terms acidic and basic to describe these conditions. If the $[H^+]$ of the solution is greater than 1.0×10^{-7}, we say the solution is **acidic**, and if the $[H^+]$ is less than 1.0×10^{-7}, we say the solution is **basic**.

Because the $[H^+]$ is so important and because it is rather cumbersome to say things like, "the $[H^+]$ of the fluid is 1.0×10^{-7} Molar," chemists have developed a shorthand to express the $[H^+]$. This shorthand expresses the $[H^+]$ as the **pH** of the solution. The pH of a solution is the **negative logarithm of the $[H^+]$** (concentration expressed as moles per liter, M). So, if the $[H^+]$ is 1.0×10^{-7} M, the pH of that solution would be 7 ($-\log 10^{-7}$ is $-(-7)$ or 7). Since this is the pH in which the $[H^+]$ and $[OH^-]$ are equal, we say that this is a **neutral solution**. When using pH, one thing that is a little confusing is that as the $[H^+]$ of a solution goes up, the pH goes down. Suppose that a solution has a $[H^+]$ of 1.0×10^{-6} M. The pH of the solution would be 6, but since the math behind pH is log base 10, the change in pH from 7 to a pH of 6 represents a 10-fold increase in hydrogen ions. Moving from a pH of 7 to pH of 5 represents a 100-fold increase. Thus, an **acidic solution** is any solution with a pH<7. Likewise, any solution that has a pH>7 is a **basic solution**. Below is an image that shows the pH of some common solutions.

pH	Examples of solutions
0	Battery acid, strong hydrofluoric acid
1	Hydrochloric acid secreted by stomach lining
2	Lemon juice, gastric acid, vinegar
3	Grapefruit juice, orange juice, soda
4	Tomato juice, acid rain
5	Soft drinking water, black coffee
6	Urine, saliva
7	"Pure" water
8	Sea water
9	Baking soda
10	Great Salt Lake, milk of magnesia
11	Ammonia solution
12	Soapy water
13	Bleach, oven cleaner
14	Liquid drain cleaner

So, there are two important lessons from this; the lower the pH, the higher the $[H^+]$, and a change in pH of one unit (7 to 6 for example) is a 10-fold change in $[H^+]$.
