

4.5

The DELETE Clause

The DELETE Clause

- You can delete single or multiple columns with a single statement.
- You can use a subquery or a WHERE clause with a DELETE statement.
- By default MySQL is in safe update mode which prevents coding a delete statement without a WHERE clause.

Code Example:

```
1 USE world;
2 DELETE
3 FROM city
4 WHERE name = 'san felipe' AND countrycode = 'chl';
```

Results:

The screenshot shows a MySQL query editor window with the following SQL code:

```
1 USE world;
2 DELETE
3 FROM city
4 WHERE name = 'san felipe' AND countrycode = 'chl';
```

The output section shows the following results:

#	Time	Action	Message
1	15:12:02	USE world	0 row(s) affected
2	15:12:02	DELETE FROM city WHERE name = 'san felipe' AND countrycode = 'chl'	1 row(s) affected

DELETE

- You begin a delete statement with the DELETE clause.

FROM city

- You must specify the table from which you are deleting rows.

WHERE name = 'san felipe' AND countrycode = 'chl';

- You should use a WHERE clause with a DELETE statement to avoid deleting every row in a table.
